

VIII. Loop Installation:

The vehicle detection characteristics of an inductive loop detector are greatly influenced by the loop size and proximity to moving metal objects such as gates. Vehicles such as small motorcycles and high bed trucks can be reliably detected if the proper size loop is selected. If the loop is placed too close to a moving metal gate, the detector may detect the gate. The diagram below is intended as a reference for the dimensions that will influence the detection characteristics.

General Rules:

- The detection height of a loop is 2/3 the shortest leg (A or B) of the loop. Example: Short leg = 6 feet, Detection Height = 4 feet.
- As the length of leg A is increased, distance C must also increase.

A =	6 ft	9 ft	12 ft	15 ft	18 ft	21 ft
C =	3 ft	4 ft	4.5 ft	5 ft	5.5 ft	6 ft

- For reliable detection of small motorcycles, legs A and B should not exceed 6 feet.

Loop Installation - Saw Cut Type

- 1. Mark the loop layout on the pavement. Remove sharp inside corners that can damage the loop wire insulation.
- 2. Set the saw to cut to a depth (typically 2" to 2.5") that ensures a minimum of 1" from the top of the wire to pavement surface. The saw cut width should be larger than the wire diameter to avoid damage to the wire insulation when placed in the saw slot. Cut the loop and feeder slots. Remove all debris from the saw slot with compressed air. Check that the bottom of the slot is smooth.
- 3. It is highly recommended that a continuous length of wire be used to form the loop and feeder to the detector. Loop wire is typically 14, 16, 18, or 20 AWG with cross-linked polyethylene insulation. Use a wood stick or roller to insert the wire to the bottom of the saw slot (do not use sharp objects). Wrap the wire in the loop saw slot until the desired number of turns is reached. Each turn of wire must lay flat on top of the previous turn.
- 4. The wire must be twisted together a minimum of 6 twists per foot from the end of the saw slot to the detector.
- 5. The wire must be held firmly in the slot with 1" pieces of backer rod every 1 to 2 feet. This prevents the wire from floating when the loop sealant is applied.
- 6. Apply the sealant. The sealant selected should have good adhering properties with contraction and expansion characteristics similar to those of the pavement material.

LOOP PERIMETER	NUMBER OF TURNS
10 feet - 13 feet	5
14 feet - 26 feet	4
27 feet - 45 feet	3
46 feet - 100 feet	2
100 feet and up	1

OPERATING INSTRUCTIONS FOR

Model BX Series

SINGLE CHANNEL LOOP DETECTORS

I. General:

Please verify source voltage before applying power. The model designation indicates the input power required, output configuration, and Fail-Safe / Fail-Secure configuration for the detector as follows.

Model BX-x-xx-x ← Blank = Fail-Safe, S = Fail-Secure

The detector is factory configured for either Fail-Safe or Fail-Secure operation (see unit side label). The output state of each output relay in either Fail-Safe or Fail-Secure mode is listed in the table below.

Relay	Fail-Safe		Fail-Secure	
	Power Failure	Loop Failure	Power Failure	Loop Failure
A	Call	Call	No Call	No Call
B	No Call	No Call	No Call	No Call

II. Indicators and Controls:

i. Power / Detect / Fail LEDs:

The detector has one green and two red LED indicators that are used to provide an indication of the detector's power status, output state, and/or loop failure conditions. The table below lists the various indications and their meanings.

Status	PWR (Power) LED	DET (Detect) LED	FAIL LED
Off	No power or low power	Output(s) Off	Loop OK
On	Normal power to detector	Output(s) On	Open Loop
Flash	N/A	4 Hz - Two second timing delay activated	1 Hz - Shorted Loop 3 Hz - Prior Loop Failure

Note: If the supply voltage drops below 75% of the nominal level, the PWR LED will turn off, providing a visual indication of low supply voltage. Model BX detectors will operate with supply voltage as low as 70% of nominal supply voltage.

ii. Front Panel Rotary Switch (Sensitivity):

The eight-position rotary switch selects one of eight (8) sensitivity levels as shown in the table below. 0 is lowest and 7 is highest, with normal (factory default) being 3. Use the lowest sensitivity setting that will consistently detect the smallest vehicle that must be detected. Do not use a sensitivity level higher than necessary.

Position	0	1	2	3 *	4	5	6	7
-ΔL/L	1.28%	0.64%	0.32%	0.16%*	0.08%	0.04%	0.02%	0.01%

* Factory default setting.

iii. Front Panel DIP Switches:

Switch	ON	OFF	Factory Default
1	Frequency (See Table under Frequency Section)		OFF
2			OFF
3	Limited Presence	True Presence™	OFF
4	Sensitivity Boost	No Boost	OFF
5	Two Second Delay	No Delay	OFF
6	Fault Output B Relay (Overrides Switches 7 & 8)	Presence / Pulse B Relay	OFF
7	Exit Pulse B Relay	Entry Pulse B Relay	OFF
8	Presence Mode B Relay	Pulse Mode B Relay	OFF

Frequency (DIP Switches 1 and 2):

In situations where loop geometry forces loops to be located in close proximity to one another, it may be necessary to select different frequencies for each loop to avoid loop interference, commonly known as crosstalk. DIP switches 1 and 2 can be used to configure the detector to operate at one of four frequencies corresponding to **Low, Medium / Low, Medium / High, and High** as shown in the table below.

NOTE: After changing any frequency switch setting(s), the detector must be reset by momentarily changing one of the other switch positions.

Switch	Frequency			
	Low (0)	Medium / Low (1)	Medium / High (2)	High (3) *
1	ON	OFF	ON	OFF *
2	ON	ON	OFF	OFF *

* Factory default setting.

Presence Hold Time (DIP Switch 3):

Output A always functions as a presence output. DIP switch 3 can be used to select one of two presence hold times; Limited Presence or True Presence™. Both modes provide a Call output when a vehicle is present in the loop detection zone. True Presence™ is selected when DIP switch 3 is **OFF**. If DIP switch 3 is **ON**, Limited Presence is selected. Limited Presence will typically hold the Call output for about one to three hours. True Presence™ will hold the Call as long as the vehicle is present in the loop detection zone provided that power is not interrupted or the detector is not reset. TruePresence™ time applies only for normal size automobiles and trucks and for normal size loops (approximately 12 ft² to 120 ft²). The factory default setting is **OFF** (True Presence™ Mode).

Sensitivity Boost (DIP Switch 4):

DIP switch 4 can be turned **ON** to increase sensitivity during the detect period without changing the sensitivity during the no detect period. The boost feature has the effect of temporarily increasing the sensitivity setting by up to two levels. When a vehicle enters the loop detection zone, the detector automatically boosts the sensitivity level. As soon as no vehicle is detected, the detector immediately returns to the original sensitivity level. This feature is particularly useful in preventing dropouts during the passage of high bed vehicles. The factory default setting is **OFF** (no Sensitivity Boost).

Output Delay (DIP Switch 5):

A two second delay of Outputs A and B can be activated by setting DIP switch 5 to the **ON** position. Output delay is the time the detector outputs are delayed after a vehicle first enters the loop detection zone. If the two second Output Delay feature is activated, the output relays will only be turned on after two seconds have passed with a vehicle continuously present in the loop detection zone. If the vehicle leaves the loop detection zone during the two second delay interval, detection is aborted and the next vehicle to enter the loop detection zone will initiate a new full two second delay interval. The detector provides an indication that vehicle is being detected but that the outputs are being delayed, by flashing the front panel **DET** LED at a four Hz rate with a 50% duty cycle. The factory default setting is **OFF** (no Output Delay).

Relay B Fault Output (DIP Switch 6):

When DIP switch 6 is in the **ON** position, Output B will operate in Fault mode. When operating in Fault mode, Relay B will provide a fault indication only when a loop fault condition exists. If a loss of power occurs, Relay B will operate as a Fail-Secure output. If the loop fault condition self-corrects, Relay B will resume operation in the No Fault output state. The factory default setting is **OFF** (Relay B Presence or Pulse).

NOTE: Setting this switch to the **ON** position overrides the settings of DIP switches 7 and 8.

Relay B Output Mode (DIP Switches 7 and 8):

Relay B has four (4) modes of operation: Pulse-on-Entry, Pulse-on-Exit, Presence, and Fault. Fault mode is selected with DIP switch 6. (See the Relay B Fault Output section on page 2 for details.) DIP switches 7 and 8 are used to configure the Presence and/or Pulse output modes of Relay B.

When set to operate in Pulse mode (DIP switch 8 set to **OFF**), Relay B can be set to provide a 250 millisecond pulse when a vehicle enters or exits the loop detection zone. DIP switch 7 is used to select Pulse-on-Entry or Pulse-on-Exit. When DIP switch 7 is **OFF**, Pulse-on-Entry is selected. When DIP switch 7 is **ON**, Pulse-on-Exit is selected.

When set to operate in Presence mode (DIP switch 8 set to **ON**), Output B presence hold time is the same as Output A.

The table below shows the various combinations of switch settings and Relay B modes of operation.

Switch	Pulse-on-Entry *	Pulse-on-Exit	Presence	Presence
7	OFF *	ON	OFF	ON
8	OFF *	OFF	ON	ON

* Factory default setting.

III. Reset:

Changing any DIP switch position (except 1 or 2) or the Sensitivity level setting will reset the detector. After changing the frequency selection switches, the detector must be reset.

IV. Call Memory:

When power is removed for two seconds or less, the detector automatically remembers if a vehicle was present and a Call was in effect. When power is restored, the detector will continue to output a Call until the vehicle leaves the loop detection zone (loss of power or power dips of two seconds or less will not bring a gate arm down onto cars as they wait at the gate).

V. Failed Loop Diagnostics:

The **FAIL** LED indicates whether or not the loop is currently within tolerance. If the loop is out of tolerance, the **FAIL** LED indicates whether the loop is shorted (one Hz flash rate) or open (steady ON). If and when the loop returns to within tolerance, the **FAIL** LED will flash at a three flashes per second rate to indicate that an intermittent loop fault has occurred and has been corrected. This flash rate will continue until another loop fault occurs, the detector is reset, or power to the detector is interrupted.

VI. Pin Connections (Reno A & E Wiring Harness Model 802-4):

Pin	Wire Color	Function		
		Conventional Outputs	Reversed Outputs	Euro Outputs
1	Black	AC Line / DC +	AC Line / DC +	AC Line / DC +
2	White	AC Neutral / DC Common	AC Neutral / DC Common	AC Neutral / DC Common
3	Orange	Relay B, Normally Open (N.O.)	Relay B, Normally Closed (N.C.)	Relay B, Normally Open (N.O.)
4	Green	No Connection	No Connection	Relay B, Common
5	Yellow	Relay A, Common	Relay A, Common	Relay A, Normally Open (N.O.)
6	Blue	Relay A, Normally Open (N.O.)	Relay A, Normally Closed (N.C.)	Relay A, Common
7	Gray	Loop	Loop	Loop
8	Brown	Loop	Loop	Loop
9	Red	Relay B, Common	Relay B, Common	No Connection
10	Violet or Black / White	Relay A, Normally Closed (N.C.)	Relay A, Normally Open (N.O.)	Relay A, Normally Closed (N.C.)
11	White / Green or Red / White	Relay B, Normally Closed (N.C.)	Relay B, Normally Open (N.O.)	Relay B, Normally Closed (N.C.)

Note: All pin connections listed above are with power applied, loop(s) connected, and no vehicle detected.

VII. Warnings:

Separately, for each loop, a twisted pair should be created consisting of only two (2) loop wires running the entire distance from the loop to the detector (including runs through all wiring harnesses) at a minimum of six (6) complete twists per foot. For trouble free operation, it is **highly recommended** that **all** connections (**including crimped connectors**) be soldered.
